

ABSTRACT OF THE DISCLOSURE

Disclosed is about a main frame of a tension mask assembly, in which the configuration of the main frame is enhanced to prevent howling, the localized tension
5 concentration of the tension mask is reduced to prevent plastic deformation or break of the tension mask in a heat treatment of a Braun tube, and stiffness can be enhanced without increasing the overall main frame size and production cost.

The tension mask assembly comprises: a tension mask having electron beam through holes shaped as a slot or grill, a sub-frame for tensioning the tension mask, and
10 main frames welded to the tension mask, wherein each of the main frames is bent at a middle portion in the width direction, and has a portion perpendicular to the tension mask defining a partition and another portion opposite to the tension mask defining a lower plane, wherein widths of a middle portion and both ends of the lower plane are formed in the range of the following equation: $0 < \frac{w_1 - w_2}{w_2} \leq 1.0$, herein, w_1 is the
15 width of the middle portion, and w_2 is the width of both ends. Alternatively, each of the main frames has a partition perpendicular to the tension mask, a lower plane perpendicularly bent from the partition with a certain width to be opposed to the tension mask, and a support bent from the lower plane to support the partition at the outer edge, wherein widths of a middle portion and both ends of the lower plane are formed in the
20 range of the following equation: $0 < \frac{y_1 - y_2}{y_2} \leq 1.0$, herein, y_1 is the width of the middle portion, and y_2 is the width of both ends. It is preferred that widths of a middle portion and both ends of the support are formed in the range of the following equation:

$0 < \frac{d_1 - d_2}{d_2} \leq 1.0$, herein, d_1 is the width of the middle portion, and d_2 is the width of

both ends.
